NAME

      nam – set, get, and delete Namaste tag files

SYNOPSIS

      nam [−**vh**] [−**o** *fmt*] [−**d** *dir*] **set** *integer string* [[*maxlen*] *ellipsis*]

      nam [−**vh**] [−**o** *fmt*] [−**d** *dir*] **get** [*integer* ...]

      nam [−**vh**] [−**o** *fmt*] [−**d** *dir*] **del** [*integer* ...]

      nam [−**vh**] [−**o** *fmt*] [−**d** *dir*] **delall**

DESCRIPTION

      The **nam** command manages Namaste tag files. A Namaste (Name−as−text) tag file holds a single meta-data value and its filename is derived from the metadata value.

OPTIONS

      −d, **−−directory**

          Use *directory* instead of the current directory to look for tag files.

      −o, **−−outformat**

          Output in format *fmt*, one of `bare` (unlabeled), `anvl`, or `xml`. Default format is `bare`.

      −v, **−−verbose**

          Output ancillary information (the tag filename itself) as a comment.

      −−help, **−?**

          Print extended help documentation.

      −−man

          Print full documentation.

      −−version

          Print the current version number and exit.

EXAMPLES

```
nam set 0 bagit_0.98
nam set 1 'Mark Twain'
nam set 2 'Adventures of Huckleberry Finn' 13m
nam get
nam delall
```
